

Control transformers STN..., DTZ Multi-winding transformer UTI Multipurpose power supply units AING

All transformers are constructed and tested according to IEC/EN 61558 guidelines. Depending on version, they can therefore be used in compliance with the safety norm IEC/EN 60204.

Single-phase STN control transformers

Complete safety for electrical controls → Page 15/4

Single/three-phase control, isolating, and STI, STZ, DTZ safety transformers

With increased insulation for the production of low voltages → Page 15/6

Single-phase UTI multi-winding transformers

Control, isolation and safety transformers according to IEC/EN 61558-2-2 +++ simple engineering as they are adapted to various worldwide control voltages → Page 15/9

Multipurpose power supply units AING

Safety transformers to IEC/EN 61558-2-6 +++ All voltages from one device +++ allow simple engineering and low wiring costs → Page 15/9

Notes**Ordering example**

When ordering, the part number must include the following details:

STN0.1(*/*)First asterisk \triangleq rated input voltage
Second asterisk \triangleq rated output voltage

- Desired part no. STN0.1
- Desired rated input voltage 200 V
- Desired rated output voltage 18.5 V

The correct part no. is

STN0.1(200/18.5)Transformer-protective circuit-breakers
PKZMO-...-T → Page 7/6**Information relevant for export to North America**

Engineering

Size selection for control transformers

Determination of the continuous rating

The control transformer must be rated in size so that the voltage drop remains within the permissible tolerance range even under unfavorable conditions. The determination of the transformer rating is performed by the addition of all the sealing powers of all loads which are to be connected simultaneously as well as addition of the inrush power of the largest load, and multiplying the result by a factor of 0.8.

If the ratings of the loads are very similar, the sum of all inrush powers of the simultaneously connected loads is added to the sum of all the sealing powers and the result is multiplied by a factor of 0.8.

Determination of the short-time rating

If the primary requirement is to switch large contactors, it is recommended that the control transformer is selected on the basis of the short-time rating. In most cases, this will mean that the transformer rating is reduced. It is important to ensure that the sealing power does not exceed the continuous rating.

Protection of control transformers

Operational conditions

The protective device shown in the table below must be connected upstream of the primary. The overheat release of the circuit-breaker must be set to the stated current. The current to be set must also be stated on the rating plate of the transformer. If a short-circuit release is present it must be set to the maximum value. The setting values of the circuit-breaker apply up to 1.06 times the rated voltage. For a higher mains voltage the +5 % terminal is to be used. In the case of transformers > 2.0 kVA (DT...> 4.0 kVA) the circuit-breaker

may trip under certain mains supply conditions ($I_k > 6 \text{ kA}$) and with unfavorable starting torque. In such cases we recommend the use of an inrush current limiter.

The inrush current limiter can be ordered as an accessory. Ordering details → Accessories

Setting range of the motor-protective circuit-breaker as a function of the STI, STZ and DTZ transformer rated power (VA)
